American Book Publishing Record

This is a completely revised edition, including new material, from 'Culture Media for Food Microbiology' by J.E.L. Corry et al., published in Progress in Industrial Microbiology, Volume 34, Second Impression 1999. Written by the Working Party on Culture Media, of the International Committee on Food Microbiology and Hygiene, this is a handy reference for microbiologists wanting to know which media to use for the detection of various groups of microbes in food, and how to check their performance. The first part comprises reviews, written by international experts, of the media designed to isolate the major groups of microbes important in food spoilage, food fermentations or food-borne disease. The history and rationale of the selective agents, and the indicator systems are considered, as well as the relative merits of the various media. The second part contains monographs on approximately 90 of the most useful media. The first edition of this book has been frequently quoted in standard methods, especially those published by the International Standards Organisation (ISO) and the European Standards Organisation (CEN), as well as in the manuals of companies manufacturing microbiological media. In this second edition, almost all of the reviews have been completely rewritten, and the remainder revised. Approximately twelve monographs have been added and a few deleted. This book will be useful to anyone working in laboratories examining food - industrial, contract, medical, academic or public analyst, as well as other

Zoonoses

Although there are a number of comprehensive books in clinical micro biology, there remains a need for a manual that can be used in the clinical laboratory to guide the daily performance of its work. Most of the existing publications provide detailed and precise information, for example, by which a microorganism can be characterized and identified beyond any doubt; however, the number of tests involved in this process exceeds the capabilities and resources of

most clinical laboratories and are irrelevant for patient care. It is, therefore, necessary in any clinical laboratory to extract from reference manuals, textbooks, and journals those tests and procedures that are to be used to complete the daily workload as efficiently and accurately as possible. It is also essential in the clinical laboratory to determine, on the basis of the kind of specimen being examined, which microorganisms are clinically relevant and require isolation and identification and which should either be excluded selectively or simply regarded as indigenous flora and, therefore, not specifically identified. Cost and time limit a laboratory's resources, and priorities must be established for handling the workload. The procedures described in this manual are those selected by our staff for use in the clinical laboratory on the basis of clinical relevance, accuracy, reproducibility, and efficiency. Alternative procedures, when considered equivalent on the basis of personal or published experience, have been included where appropriate.
