Like most young pastors, God had given me great confirmation and assurance that this was his leading in my life. However, once I got into the deep waters of pastoring, I quickly realized I did not know how to swim. It almost appeared that God was not fair, blessing some but allowing others to suffer. Well, now I know that's not true. Many pastors waste precious years learning, not knowing what to do. Due to a lack of training, tutoring, and teaching, they are stuck in the week-to-week cycle of just going to church. Digital technology has revolutionized modern television but what exactly has changed? The history of the digital transition is one of great scientific achievement, expensive failures, and significant political and industrial power struggles. In Shut Off: The Canadian Digital Television Transition, Gregory Taylor examines the technology, institutional players, and the policies that have shaped Canada's efforts to switch from analogue to digital television broadcasting. Taylor shows how digital television is part of a global media movement by comparing the Canadian experience with the ways in which the digital transition has been managed worldwide. Shut Off is about more than television - the digital transition is also a precursor for new developments in mobile digital media. The wireless spectrum freed by the move to digital television is a multi-billion dollar public resource, whose auction is impending. The book reveals how digital broadcasting has been the site of dramatic change in the political economy of Canadian media, and questions the market-driven process through which the still incomplete transition has unfolded. Considering wide-ranging issues such as equal access and television as a public good, Taylor highlights public and institutional actors in the policy process to provide an analysis of government and industry. Succinct and insightful, Shut Off is a timely assessment of a period of technological and economic upheaval in Canadian broadcasting.

The brief provides a set of cooperative networking algorithms, which rely on the concepts of short-term call traffic load prediction,

network cooperation, convex optimization, and decomposition theory. In the proposed solutions, mobile terminals play an active role in the resource allocation operation, instead of their traditional role as passive service recipients in the networking environment.
