The Art of the John Deere Tractor

Power Trains

In the 1960s and 1970s, John Deere's tractors evolved dramatically from small machines into large, powerful tractors with modern advances and muscular engines; it was a period of the greatest changes since the 1920s. Deere christened these tractors the New Generation. This book in the Tractor Legacy series examines these Big Green machines in detail, with archival and current photography of restored tractors, a thorough historical text, and details of model specifications and variations.

John Deere New Generation and Generation II Tractors

This book is a collection of 13 articles which grew out of a workshop on federalism and democratisation in Asia. But, unlike a great many of the publications which have their origins in conferences, this volume has a clear theme running through its contributions, almost all of which are excellent. . . The individual country studies. . . are highly informative, most making imaginative use of the country's history and current politics to illustrate the theme of the tension between nationalising centralisation and pressures for regional decentralisation. Many of these chapters have innovative conclusions about ways in which this tension can be understood. . . this is a serious book, very well produced and indexed. Its chapters are well written with useful notes and lists of references. The volume will be of great interest to specialists on the countries concerned, and has much to offer for anyone with an interest in federalism and the relationship between regionalism and democratisation. Campbell Sharman, *The Australian Journal of*

Public Administration Federalism in Asia provides a valuable resource, both for scholars of Asia in general and for political theorists of federalism. In an academic climate where edited volumes are often assumed to be a lightweight option, Federalism in Asia demonstrates how rewarding this form of publication can be. Graham K. Brown, Political Studies Review Until now there have been few attempts to examine the different models of federalism appropriate in Asia, let alone to trace the extent to which these different perspectives are compatible, converging, or mutually influencing each other. This book redresses the balance by demonstrating the varieties of Asian federalism. Federalism in Asia explores the range of theoretical perspectives that shape debates over federalism in general, and over territorial, multinational, hybrid, and asymmetric federalism in particular relation to Asia. The contributors share their understanding of how federal or quasi-federal institutions manage ethnic conflicts and accommodate differences, how democratization facilitates the development of federalism and how federalism facilitates or inhibits democratization in Asia. Their conclusion is that hybrid federalism or quasi-federalism is more prevalent in some Asian countries than others; and the need and potential for greater federalism in more Asian countries makes this sortie into this area worthwhile. While federalism is relevant to Asia, the working pattern of Asian federalism does not necessarily follow a Western style. Hybrid federal institutional design can be seen as an Asian strategy of managing ethnic conflicts through federal arrangements. This unique book will be of great interest to a wide range of scholars and researchers who work on issues of federalism, political economy, public policy, ethnic relations, cultural diversity and democratization in the Asian region. Policymakers and activists dealing with issues of minority rights and ethnic conflict in the region, government officials and NGOs within Asia, and officials in international agencies and organizations will also find much to engage them.

An understanding of the developments in classical analysis during the nineteenth century is vital to a full appreciation of the history of twentieth-century mathematical thought. It was during the nineteenth century that the diverse mathematical formulae of the eighteenth century were systematized and the properties of functions of real and complex variables clearly distinguished; and it was then that the calculus matured into the rigorous discipline of today, becoming in the process a dominant influence on mathematics and mathematical physics. This Source Book, a sequel to D. J. Struik's Source Book in Mathematics, 1200-1800, draws together more than eighty selections from the writings of the most influential mathematicians of the period. Thirteen chapters, each with an introduction by the editor, highlight the major developments in mathematical thinking over the century. All material is in English, and great care has been taken to maintain a high standard of accuracy both in translation and in transcription. Of particular value to historians and philosophers of science, the Source Book should serve as a vital reference to anyone seeking to understand the roots of twentieth-century mathematical thought.

This textbook guides the reader towards various aspects of growth and international trade in a Diamond-type overlapping generations framework. Using the same model type throughout the book, timely topics such as growth with bubbles, debt reduction in rich countries and policies to mitigate climate change are explored. The first part starts from the "old" growth theory and bridges to the "new" growth theory (including R&D and human capital approaches). The second part presents an intertemporal equilibrium theory of inter and intra-sectoral trade and concludes by analyzing the debt mechanics inducing the huge imbalances among eurozone countries. The book is primarily addressed to graduate students wishing to proceed to the analytically more demanding journal literature.

Polyolefin is a major industry that is important for our economy and impacts every aspect of our lives. The discovery of new transition metal-based catalysts is one of the driving forces for the further advancement of this field. Whereas the classical heterogeneous Ziegler-Natta catalysts and homogeneous early transition metal metallocene catalysts remain the workhorses of the polyolefin industry, in roughly the last decade, tremendous progress has been made in developing non-metallocene-based olefin polymerization catalysts. Particularly, the discovery of

late transition metal-based olefin polymerization catalysts heralds a new era for this field. These late transition metal complexes not only exhibit high activities rivaling their early metal counterparts, but more importantly they offer unique properties for polymer architectural control and copolymerization with polar olefins. In this book, the most recent major breakthroughs in the development of new olefin polymerization catalysts, including early metal metallocene and non-metallocene complexes and late transition metal complexes, are discussed by leading experts. The authors highlight the most important discoveries in catalysts and their applications in designing new polyolefin-based functional materials.
