Scherzo "How will gravity array itself, if wit is already cloaked so darkly?", asked Robert Schumann in his review of Chopin's Scherzo in B minor, Op. 20. His astonishment is easily understood, since the name "scherzo" (It.) literally means "joke", whereas Chopin's scherzos are almost never humorous or light-hearted. Quite the contrary: the four expansive one-movement works to which Chopin gave the title scherzo are marked with a drama and form which were unprecedented in the genre. They are given here in chronological order: Scherzo in B minor, Op. 20, published in 1835 (date of composition difficult to establish precisely) Scherzo in B flat minor, Op. 31, completed 1837 and published the same year Scherzo in C sharp minor, Op. 39, composed 1839, published the following year Scherzo in E major, Op. 54, composed 1842-1843, published 1843 The scherzo appeared on the threshold of the Baroque era (e.g. Monteverdi's Scherzi musicali, 1607), initially as a vocal-instrumental genre of a cheerful character. Chopin, however, referred to the much later, classical, instrumental scherzo of tripartite, A B (trio) A, construction, in a rapid tempo and triple time, usually forming part of a larger work (sonata, symphony). In keeping with their name, most scherzos before Chopin were marked by brightness and levity;

only with Beethoven did the scherzo sometimes gain a different expression: full of anxiety and unbridled energy, almost demonic.

Interconnecting Smart Objects with IP: The Next Internet explains why the Internet Protocol (IP) has become the protocol of choice for smart object networks. IP has successfully demonstrated the ability to interconnect billions of digital systems on the global Internet and in private IP networks. Once smart objects can be easily interconnected, a whole new class of smart object systems can begin to evolve. The book discusses how IP-based smart object networks are being designed and deployed. The book is organized into three parts. Part 1 demonstrates why the IP architecture is well suited to smart object networks, in contrast to non-IP based sensor network or other proprietary systems that interconnect to IP networks (e.g. the public Internet of private IP networks) via hard-to-manage and expensive multi-protocol translation gateways that scale poorly. Part 2 examines protocols and algorithms, including smart objects and the low power link layers technologies used in these networks. Part 3 describes the following smart object network applications: smart grid, industrial automation, smart cities and urban networks, home automation, building automation, structural health monitoring, and container tracking. Shows in detail how connecting smart objects impacts our lives with practical implementation examples and case studies Provides an in depth understanding of the technological and architectural aspects underlying smart objects technology Offers an in-depth examination of relevant IP protocols to build large scale smart object networks in support of a myriad of new services
