### PHIGS Programming Manual

Modern projects are all about one group of people delivering benefits to others, so it's no surprise that the human element is fundamental to project management. The Gower Handbook of People in Project Management is a complete guide to the human dimensions involved in projects. The book is a unique and rich compilation of over 60 chapters about project management roles and the people who sponsor, manage, deliver, work in or are otherwise important to project success. It looks at the people-issues that are specific to different sectors of organization (public, private and third sector); the organization of people in projects, both real and virtual; the relationship between people, their roles and the project environment; and the human behaviours and skills associated with working collaboratively. Thus this comprehensive and innovative handbook discusses all the important topics associated with employing, developing and managing people for successful projects. The contributors have been drawn from around the world and include experts ranging from practising managers to academics and advanced researchers. The Handbook is divided into six parts, which begin with management and project organization and progress through to more advanced and emerging practices. It benefits hugely from Lindsay Scott's expert knowledge and experience in this field and from Dennis Lock's contributions and meticulous editing to ensure that the text and illustrations are always lucid and informative.

The Management Survival Manual for Engineers provides this information, creating the bridge between the world of science and the working organization. The text discusses the management of technology within the organization, the management of the engineering department, and the management of engineering projects through technical approaches and personnel aspects. The Management Survival Manual for Engineers introduces the engineer to basic management of engineering, encouraging essential leadership and managerial philosophies. The book acts as a primary resource for engineers moving into managerial areas as opposed to technological ones. It addresses a multitude of topics, enabling the reader to grasp general concepts before addressing more specific concepts. Topics include: Examining the inter-organizational behavior, procedures, and policies required to work in formal organizations. Identifying the required knowledge of leadership Outlining the principles for effective communication skills Determining the responsibilities of the organization and engineering manager for preparing the new engineer entering the organization Introducing how engineering functions in the organization Forming a basic understanding for project management Describing the transition from new engineer to supervisor The Management Survival Manual for Engineers emphasizes an understanding of people, the organization, and management as opposed to technology - serving engineers entering the

A proposal for a new global approach for fisheries focused on reducing fishing capacity and providing incentives for long-term sustainability. The Earth's oceans are overfished, despite more than fifty years of cooperation among the world's fishing nations. There are too many boats chasing too few fish. In *Saving Global Fisheries*, J. Samuel Barkin and Elizabeth DeSombre analyze the problem of overfishing and offer a provocative proposal for a global regulatory and policy approach. Existing patterns of international fisheries management try to limit the number of fish that can be caught while governments simultaneously subsidize increased fishing capacity, focusing on fisheries as an industry to be developed rather than on fish as a resource to be conserved. Regionally based international management means that protection in one area simply shifts fishing efforts to other species or regions. Barkin and DeSombre argue that global rather than regional regulation is necessary for successful fisheries management and emphasize the need to reduce subsidies. They propose an international system of individual transferable quotas that would give holders of permits an interest in the long-term health of fish stocks and help create a sustainable level of fishing capacity globally.
