This well-respected text gives an introduction to the theory and application of modern numerical approximation techniques for students taking a one- or two-semester course in numerical analysis. With an accessible treatment that only requires a calculus prerequisite, Burden and Faires explain how, why, and when approximation techniques can be expected to work, and why, in some situations, they fail. A wealth of examples and exercises develop students' intuition, and demonstrate the subject's practical applications to important everyday problems in math, computing, engineering, and physical science disciplines. The first book of its kind built from the ground up to serve a diverse undergraduate audience, three decades later Burden and Faires remains the definitive introduction to a vital and practical subject. Student's Solutions Manual, Young, Freedman, University Physics, Ninth Edition

You probably already have a clear idea of what a "discussion guide for students" is: a series of not-very-interesting questions at the end of a textbook chapter. Instead of triggering thought-provoking class discussion, all too often these guides are time-consuming and ineffective. This is not that kind of discussion guide. *What Media Classes Really Want To Discuss* focuses on topics that introductory textbooks generally ignore, although they are prominent in students' minds. Using approachable prose, this book will give students a more precise critical language to discuss "common sense" phenomena about media. The book acknowledges that students begin introductory film and television courses thinking they already know a great deal about the subject. *What Media Classes Really Want To Discuss* provides students with a solid starting point for discussing their assumptions critically and encourages the reader to argue with the book, furthering the 'discussion' on media in everyday life and in the classroom.
